
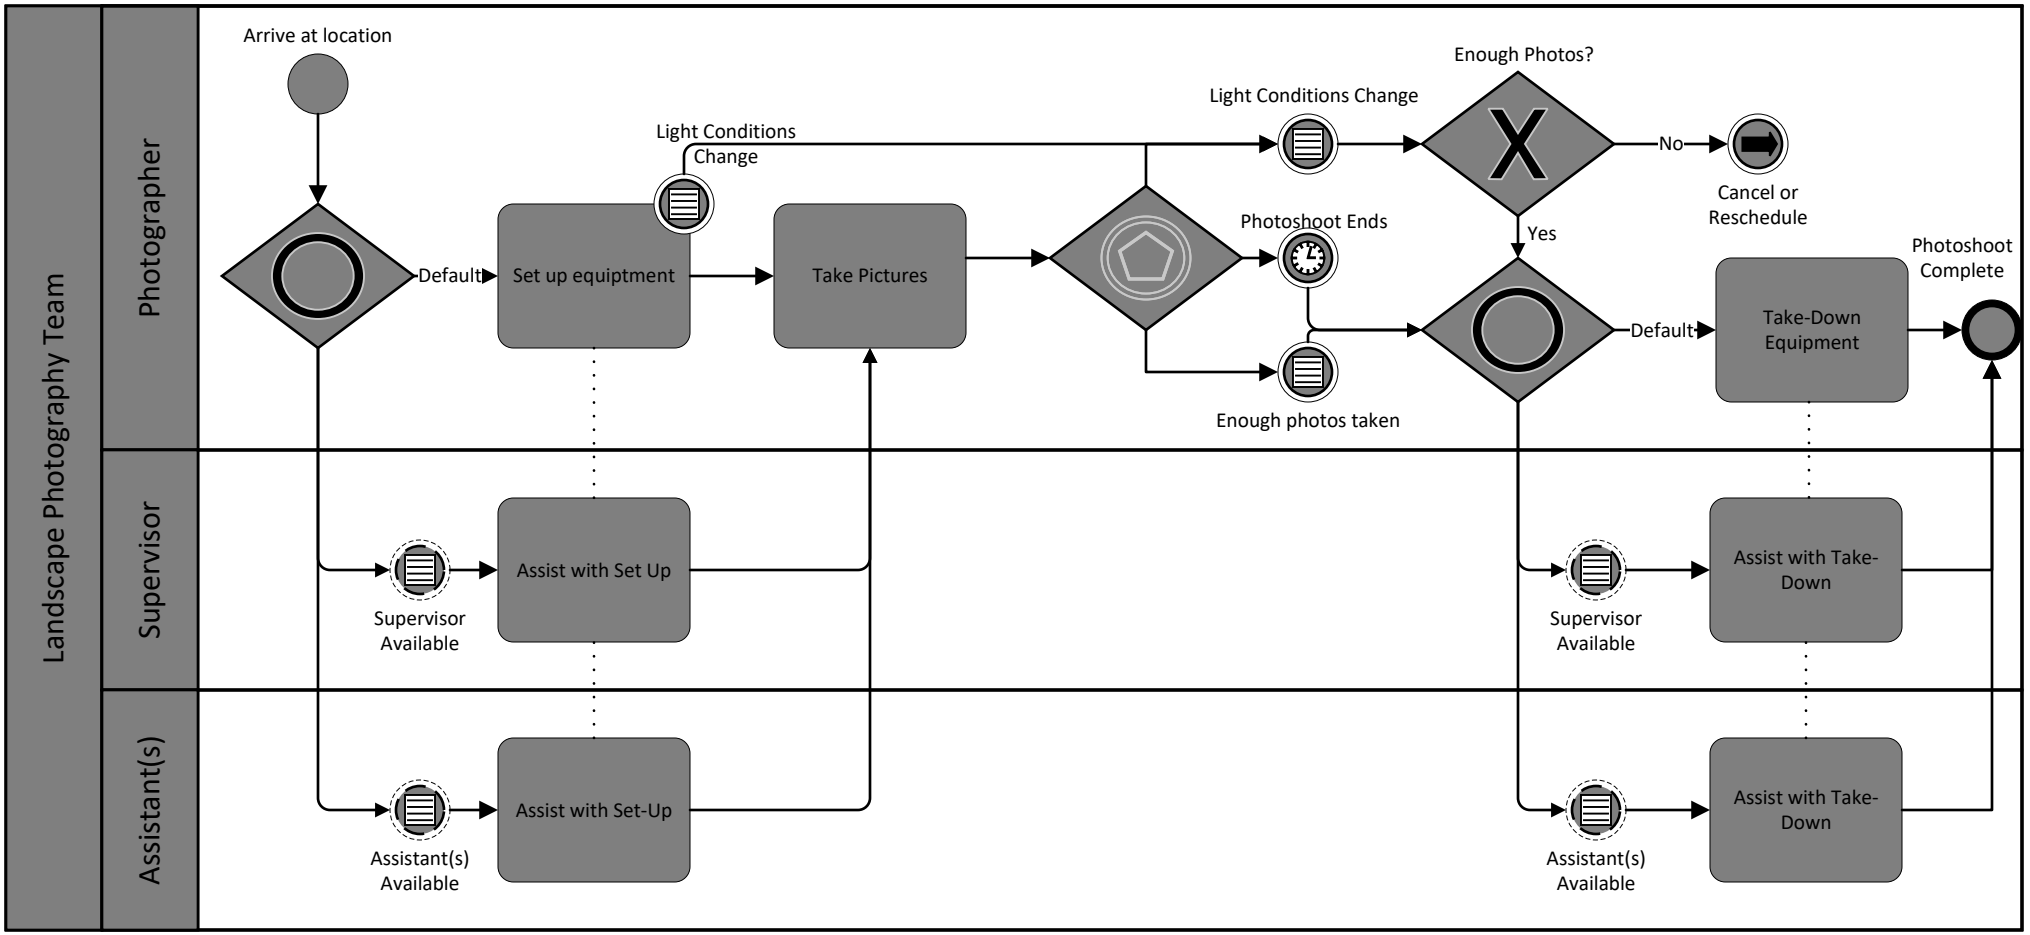
Landscape Photography Process



Photoshoot Sub-Process

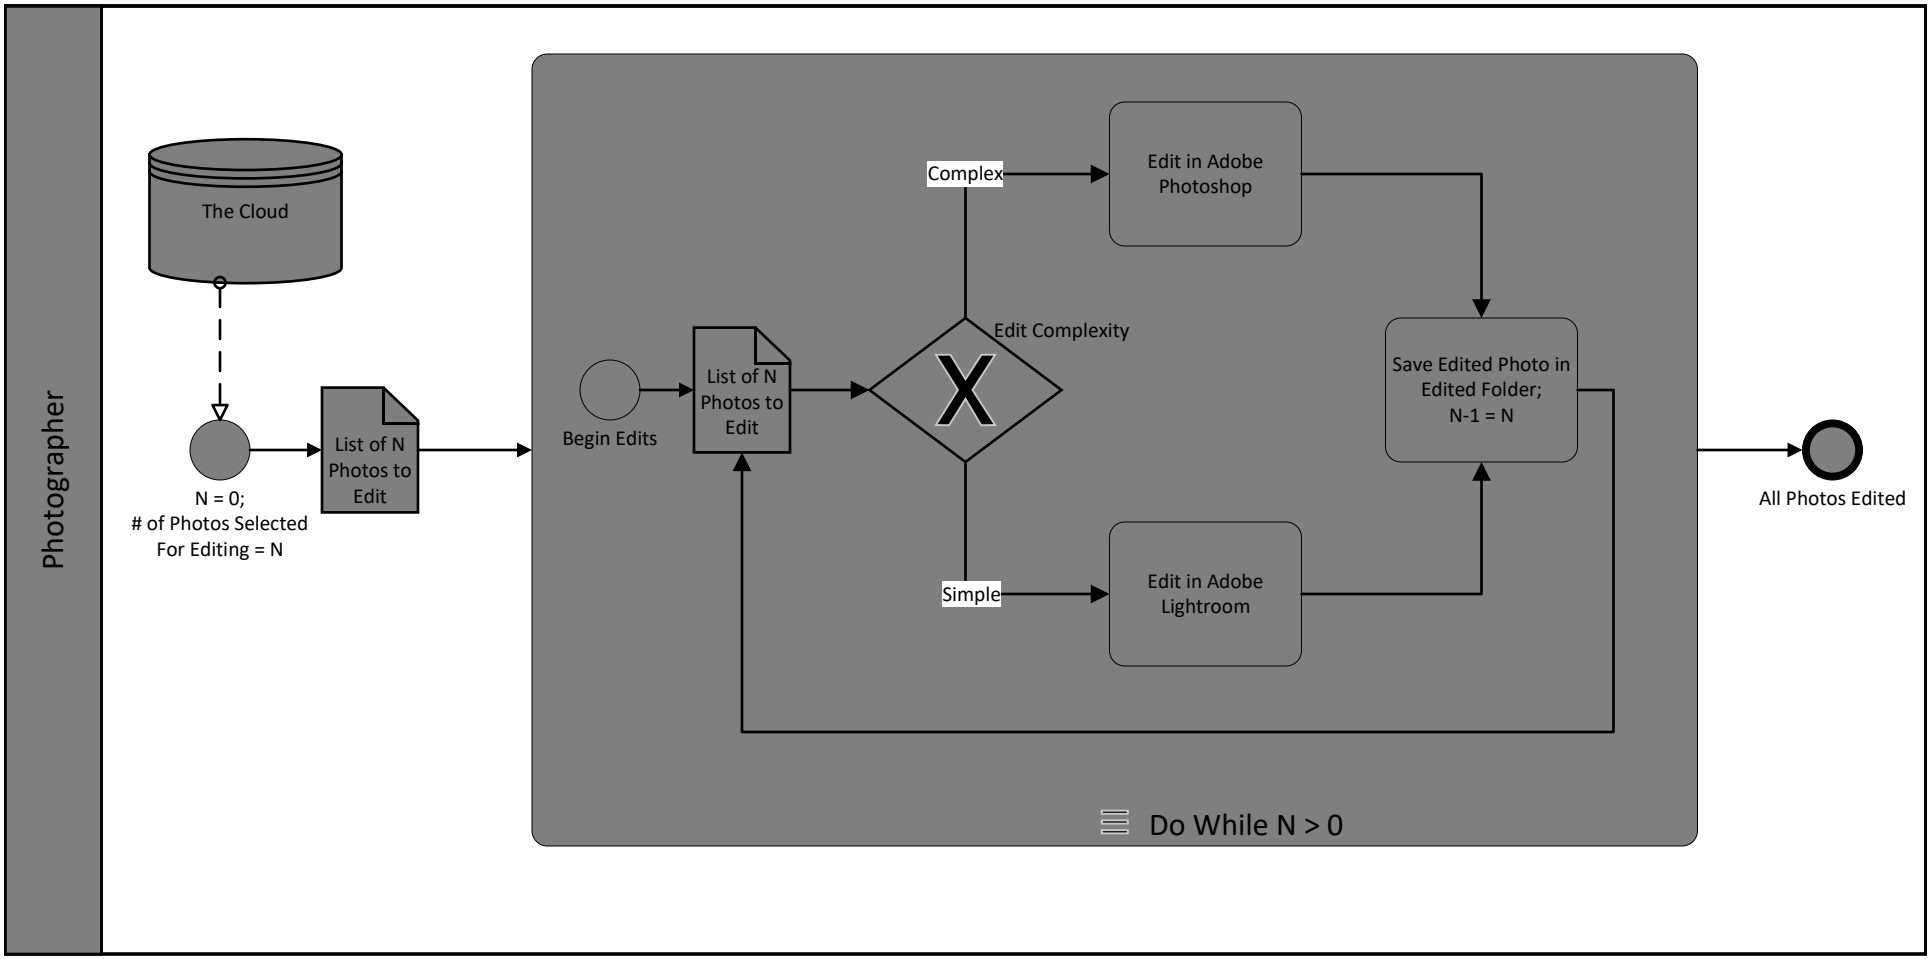


Photo Editing Sub-Process

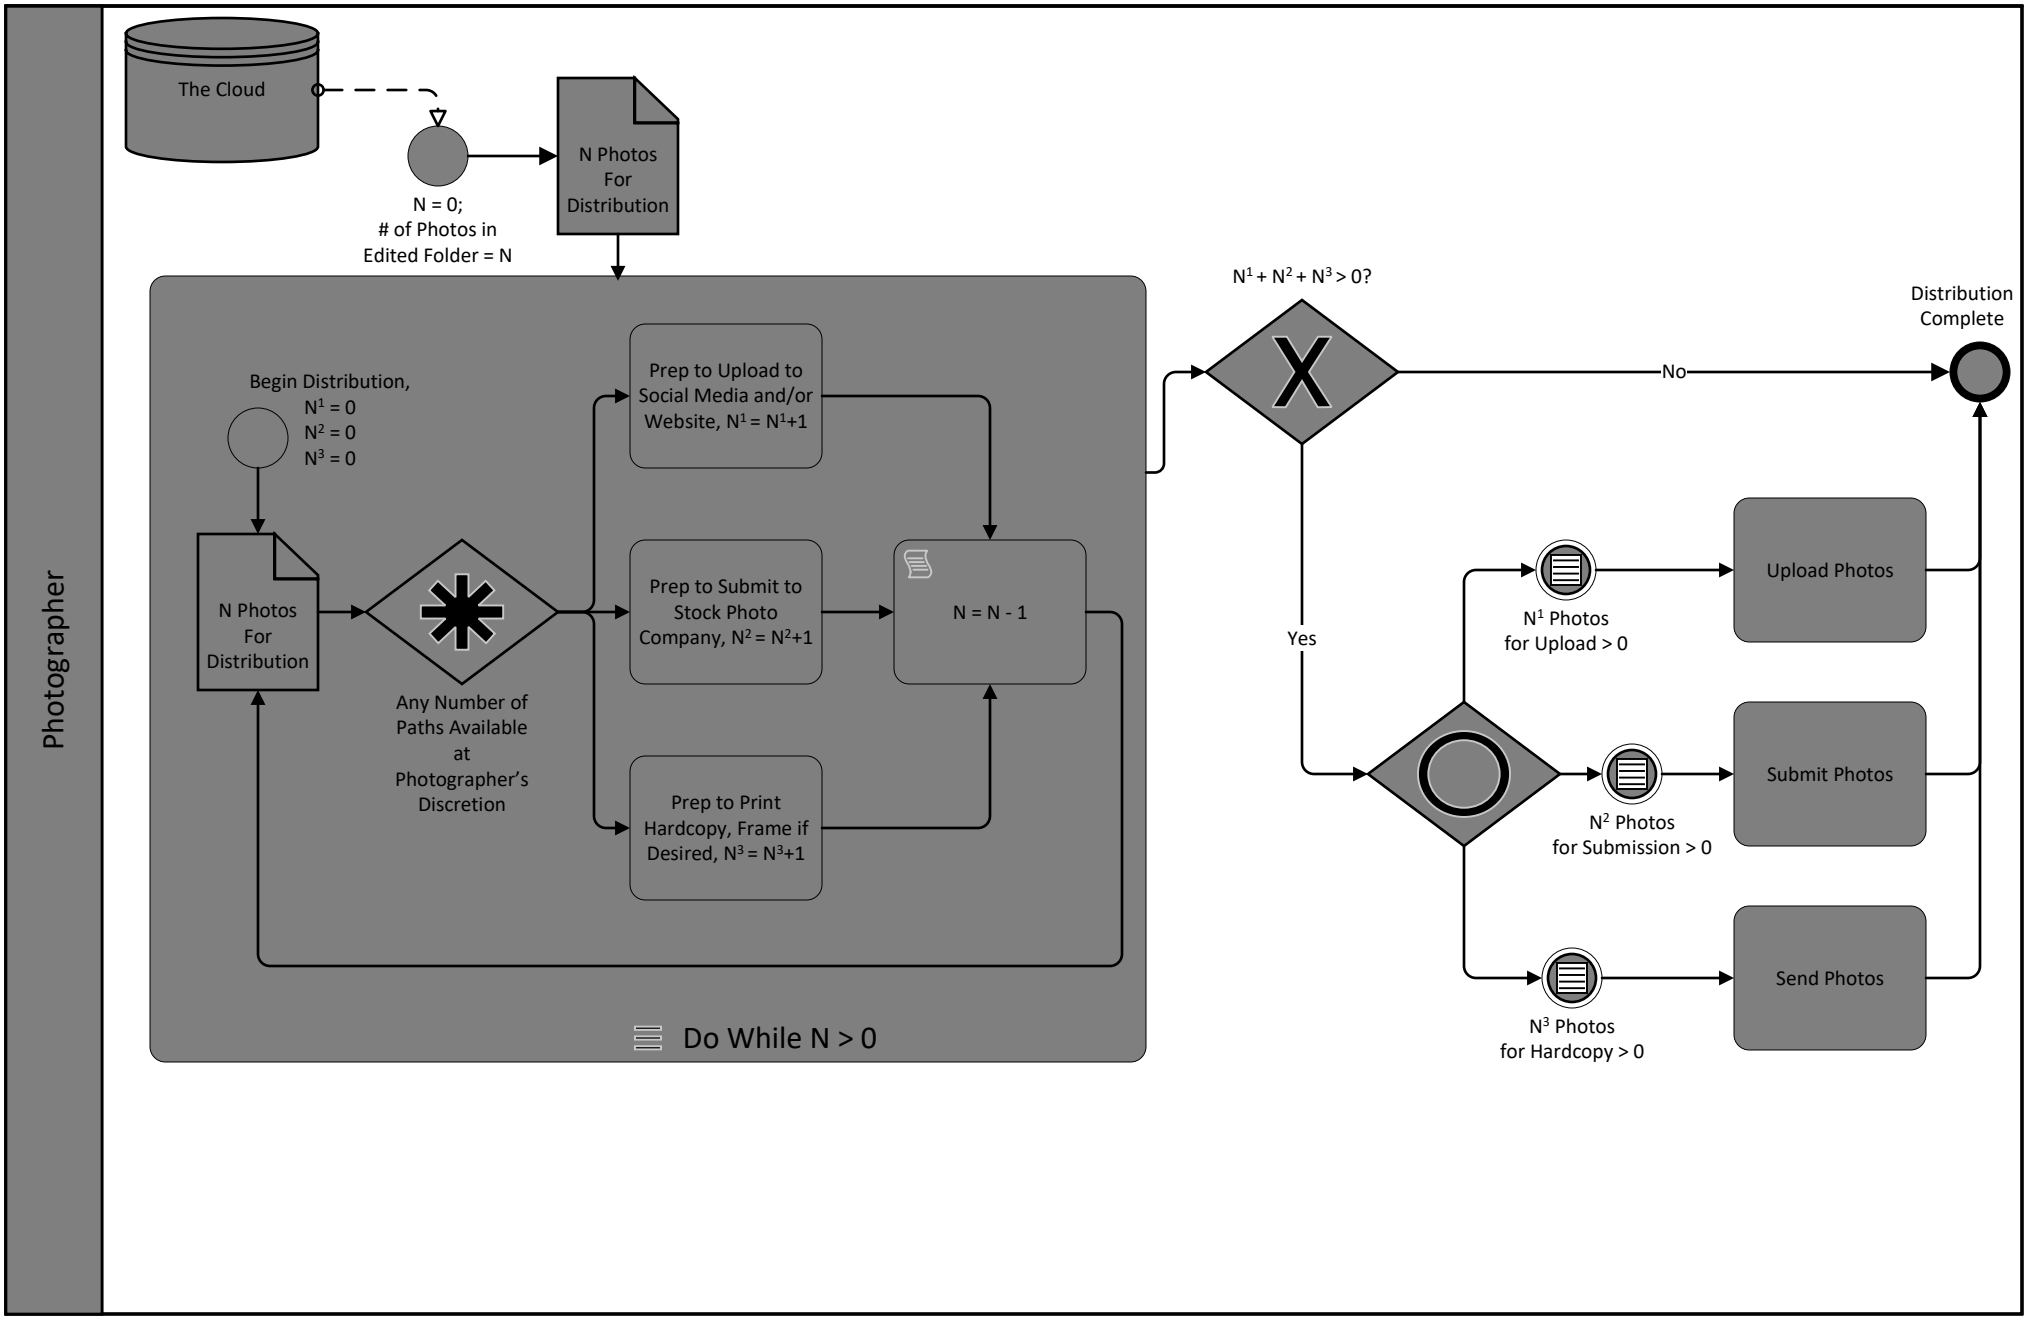

Photo Distribution Sub-Process

Notes:

- My personal preference is not to use closing gateways because I find in many of the processes I map, an Exclusive Gateway does not return to the same path. Using a closing gateway in some places, but not others decreases readability in my opinion.
- I created Photoshoot, Photo Editing, and Photo Distribution as Callable Sub-Processes because they are complex enough to warrant their own sub-processes and they could be used by other teams beyond just the Landscape Photography Team.
- I used N and some variations to indicate a variable that can be changes mid-process. This allows for more intuitive use of sequential multi-instance loops. N does not carry between processes/sub-processes and is denoted as N = 0 at the start of each process.
- I chose to use sequential multi-instance loops to address photos one at a time in the Editing and Distribution sub-processes. This could be done with a Standard Loop and Conditional Exit.
